

## Anaplasmosis

Report within 48 hours of recognition or strong suspicion of illness to Maine CDC 1-800-821-5821

Definition	Role of the School Nurse
Signs and Symptoms	Exclusions
Transmission	Reporting
Diagnosis/Treatment	Resources

### Definition

Anaplasmosis is an infection caused by the bacterium *Anaplasma phagocytophilum*. The bacterium is transmitted by the bite of an infected deer tick.

### Signs and symptoms

Symptoms of anaplasmosis can range from very mild to very severe illness. These symptoms may include fever, headache, muscle pain, malaise, chills, nausea/abdominal pain, cough, and confusion. Severe clinical presentations may include difficulty breathing, hemorrhage, renal failure or neurological problems.

Anaplasmosis can be a serious illness that can be fatal if not treated correctly. People who are immunocompromised or elderly are more at risk for severe disease.

### Transmission

Anaplasmosis is primarily transmitted to a person through the bite of an infected deer tick (*Ixodes scapularis*). This tick is endemic in the state of Maine, and can be found throughout the state. Anaplasmosis can also be transmitted by receiving transfusions from a blood donor who is infected with *Anaplasma phagocytophilum*.

### Diagnosis

Anaplasmosis is diagnosed by clinical symptoms and laboratory tests. A blood test is necessary for confirmation. Co-infections with other tick-borne diseases may occur and should be considered.

### Treatment Recommendations

- If symptoms are noted, the child should be referred to his or her primary care provider for treatment.

### Role of the School Nurse

#### Prevention

- Provide education to students and staff regarding prevention efforts including: Wearing protective clothing, using an EPA approved repellent, using caution in tick infested areas, and performing daily tick checks.
- School nurse should encourage the use of EPA approved repellents when outside (following local policy guidelines), and always performing a tick check when returning indoors.
  - School nurses can apply repellent with parental permission (see <http://www.maine.gov/agriculture/pesticides/schoolipm/what/whats-new.htm>)
- If a tick is found, the school nurse should remove the tick using tweezers or a tick spoon. Identification of the tick may be useful.
- Tick identification cards are available at: <http://www.maine.gov/dhhs/mecdc/infectious-disease/epi/vector-borne/posters/index.shtml>. Whole ticks in safe containers may be given to the parents.
- Testing of the tick is not recommended.

Several effective antibiotic treatments are available and are usually prescribed for at least 10 - 14 days.

**Exclusions**

- There is no need to exclude students from school for anaplasmosis.
- Educational modifications may be warranted in children with a positive diagnosis.

**Reporting Requirements**

- Anaplasmosis is reportable within 48 hours of recognition or strong suspicion of illness.
